

Mathematical Analysis Lecture 28 定积分的应用

1. 几何图形的面积:

→ 直角坐标情形, $y=f(x) > 0$ 与 $x=a, x=b, x$ 轴围成的曲边梯形面积 $A = \int_a^b f(x) dx$.

证: $dA = f(x)(x+dx-x) \therefore dA = f(x)dx$ 两侧积分: $A = \int_a^b f(x)dx$ 定积分存在时, 操作有很强的任意性.

$y=f(x)$ 与 $y=g(x), x=a, x=b$ 围成图形的 $S = \int_a^b |f(x)-g(x)| dx$.

e.g. 求 $y^2=x$ 与 $y=x^2$ 在第一象限围成图形的面积.

$$S = \int_0^1 (\sqrt{x} - x^2) dx = \left(\frac{2}{3} x^{\frac{3}{2}} - \frac{1}{3} x^3 \right) \Big|_0^1 = \frac{1}{3}.$$

e.g. 求 $y^2=2x$ 与 $y=x-4$ 所围成面积.

$$\text{坐标变换: } \int_{-2}^4 (4+y-\frac{1}{2}y^2) dy = (4y + \frac{1}{2}y^2 - \frac{1}{6}y^3) \Big|_{-2}^4 = 18.$$

e.g. 求椭圆面积: $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad r = a - (a-b)\sin\theta$

$$dl = r \cdot d\theta \quad dS = \frac{1}{2} r \cdot dl = \frac{1}{2} (a - (a-b)\sin\theta)^2 d\theta.$$

$$S = \int_0^{2\pi} \left(\frac{1}{2} a^2 - a(a-b)\sin\theta + \frac{1}{2} (a-b)^2 \sin^2\theta \right) d\theta = \frac{1}{2} a^2 \theta \Big|_0^{2\pi} + \frac{1}{2} (a-b)^2 \int_0^{2\pi} \sin^2\theta d\theta = \pi a^2 + 2(a-b)^2 \int_0^{\frac{\pi}{2}} \sin^2\theta d\theta.$$

→ 极坐标情形: 设 $\varphi(\theta) \in C[\alpha, \beta], \varphi(\theta) > 0$, 求 $r=\varphi(\theta), \theta=\alpha, \theta=\beta$ 围成的曲边扇形的面积.

$$dS = \frac{1}{2} r^2 d\theta \quad S = \frac{1}{2} \int_{\alpha}^{\beta} r^2 d\theta.$$

e.g. 求 $r=a\theta$ 所求的面积: $0 \rightarrow 2\pi$.

$$S = \int_0^{2\pi} \frac{1}{2} (a\theta)^2 d\theta = \frac{1}{6} a^2 \theta^3 \Big|_0^{2\pi} = \frac{4}{3} \pi^3 a^2.$$

e.g. 求 $r=a(1+\cos\theta) \quad 0 \rightarrow 2\pi, S$.

$$S = \int_0^{2\pi} \frac{1}{2} a^2 (1+\cos\theta)^2 d\theta = \frac{1}{2} a^2 \theta \Big|_0^{2\pi} + 0 + \int_0^{2\pi} \left(\frac{1}{4} a^2 (2\cos^2\theta - 1) + \frac{a^2}{4} \right) d\theta = \frac{3}{4} a^2 \theta \Big|_0^{2\pi} = \frac{3}{2} a^2 \pi.$$

二. 平面曲线的弧长:

$$dl = \sqrt{dx^2 + dy^2} = \sqrt{dx^2 + (f'(x)dx)^2} = \sqrt{1+f'(x)^2} \cdot dx \text{ 考方便好求}$$

$$\therefore l = \int_a^b \sqrt{1+f'(x)^2} dx \quad \text{若 } \lim_{n \rightarrow \infty} \sum_{i=1}^n |M_{i-1} - M_i| \text{ 存在, 则可求}$$

Theorem: 任意光滑曲线弧都可求长

$$\begin{cases} x = \varphi(t) \\ y = \psi(t) \end{cases} \therefore l = \int_{t_0}^{t_1} \sqrt{\varphi'(t)^2 + \psi'(t)^2} dt \quad \text{注意上下界}$$

$$\text{极坐标: } ds = \sqrt{r^2(\theta) + r'^2(\theta)} d\theta \quad \dots$$

关键: 不能用 $dl = r \cdot d\theta$, 不一定垂直

$$\text{e.g. } ds = c \, dh \frac{x}{c} = \sqrt{1 + (\sinh \frac{x}{c})^2} dx.$$

$$1 + \sinh^2 t = \cosh^2 t.$$
